

## **Hostfully QA Engineer Cypress exercise**

**Include a brief explanation of how you approached the task and why you made certain decisions.**

Since, the task have a website where have a CRUD based system, where we can create, edit, delete a computer and see all computers added in a table, these actions can be considered the application core, where, the creation are the most important between them all.

To guide myself between organizing test cases, I did a little of an exploratory testing, added a computer, tried to edit and delete one item. Also, sorted all rows in the table.

Following the testing session and considering the all wrote before, I tested the create, edit and delete components.

While writing the cases, I found some edge cases where can alter the site behavior, since, it is something that the user can find in a daily usage, I choose to automated these. I considered the website does not grant database access freely so I was not able to see the alterations in real-time.
